Home page (index.html)

Authentication page (auth.html)

Chat Room page (chat.html)

Page height and scroll behavior: The container that has the chat messages is **of fixed height and has a scrollbar,** and should always auto-scroll to the bottom of the container when the page is loaded or a new chat message is posted. This behavior will be handled by the client script when you add behavior to the page: don't worry about it as yet when you are designing the page for Milestone 1.

Use of an image for the Post button: If you are using an image for the Post button as above, then you should use an `img` element, and wrap the `img` element within a `button` element of type "submit". This allows the build process to copy the image to the proper place in the output folder `.dist`.

Friend List page (friends.html)

Page height and scroll behavior: The **page height is variable** and will grow vertically downwards when new friends are added. The page should always auto-scroll to the bottom of the window when a new friend is added or when the page is loaded! If the list of friends is in a container of fixed height (it doesn't have to be), then that container must auto-scroll all the way to the bottom. When you are designing the page for Milestone 1, don't worry about the scroll behavior as yet: you will take care of it when you add the client script to the page.
